TRIANGLE INFOSECON 2026 · LEADERSHIP TRACK

When Everything Depends on Everything

What breaks when security fails in cascades, not silos.

Mike Faas · CTO + CISO

IDENTITY	DEVICES	EMAIL	BACKUP
B	B	C	B

NETWORK	DATA PROTECTION	VENDOR RISK	INCIDENT READINESS
B	A	B	B

“Are we secure?”

IDENTITY	DEVICES	EMAIL	BACKUP
B	B	C	B

NETWORK	DATA PROTECTION	VENDOR RISK	INCIDENT READINESS
B	A	B	B

“I can describe each square.
I can’t tell you what happens
when one of them fails.”

Eight grades.
Zero lines between them.

We score security like it's complicated.
It isn't.

Security doesn't fail in silos.
It fails in cascades.

Three failures · the math · a graph · Monday

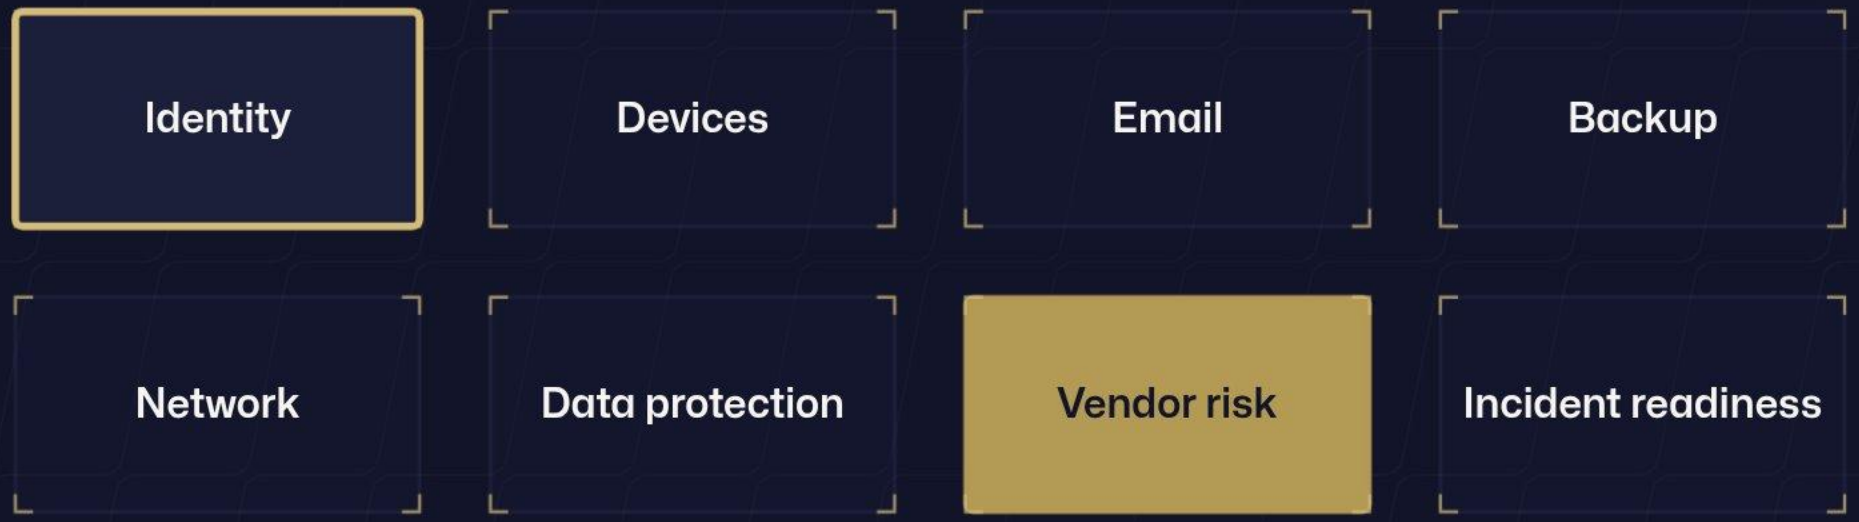

CIS · NIST · ISO · PCI · SOC 2

Decompose. Score each part.
Add it up.

Eight domains. Eight dashboards. Eight budgets. Zero connections.

- Identity
- Devices
- Email
- Backup
- Network
- Data protection
- Vendor risk
- Incident readiness

A cascade is a dependency.

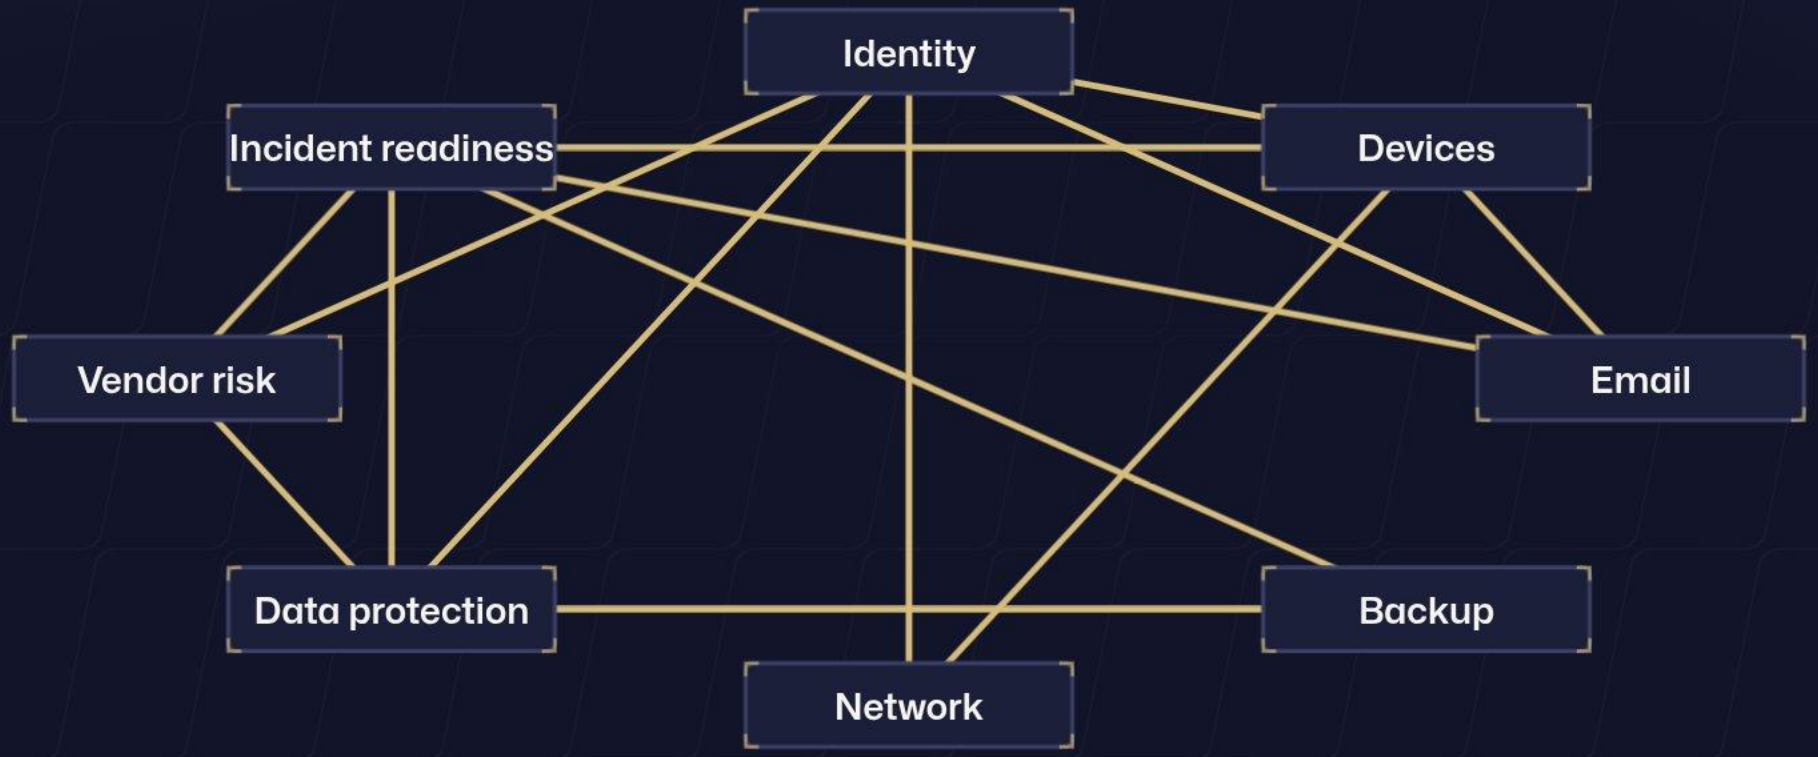

Square B needs square A to work.

A cascade is a dependency.

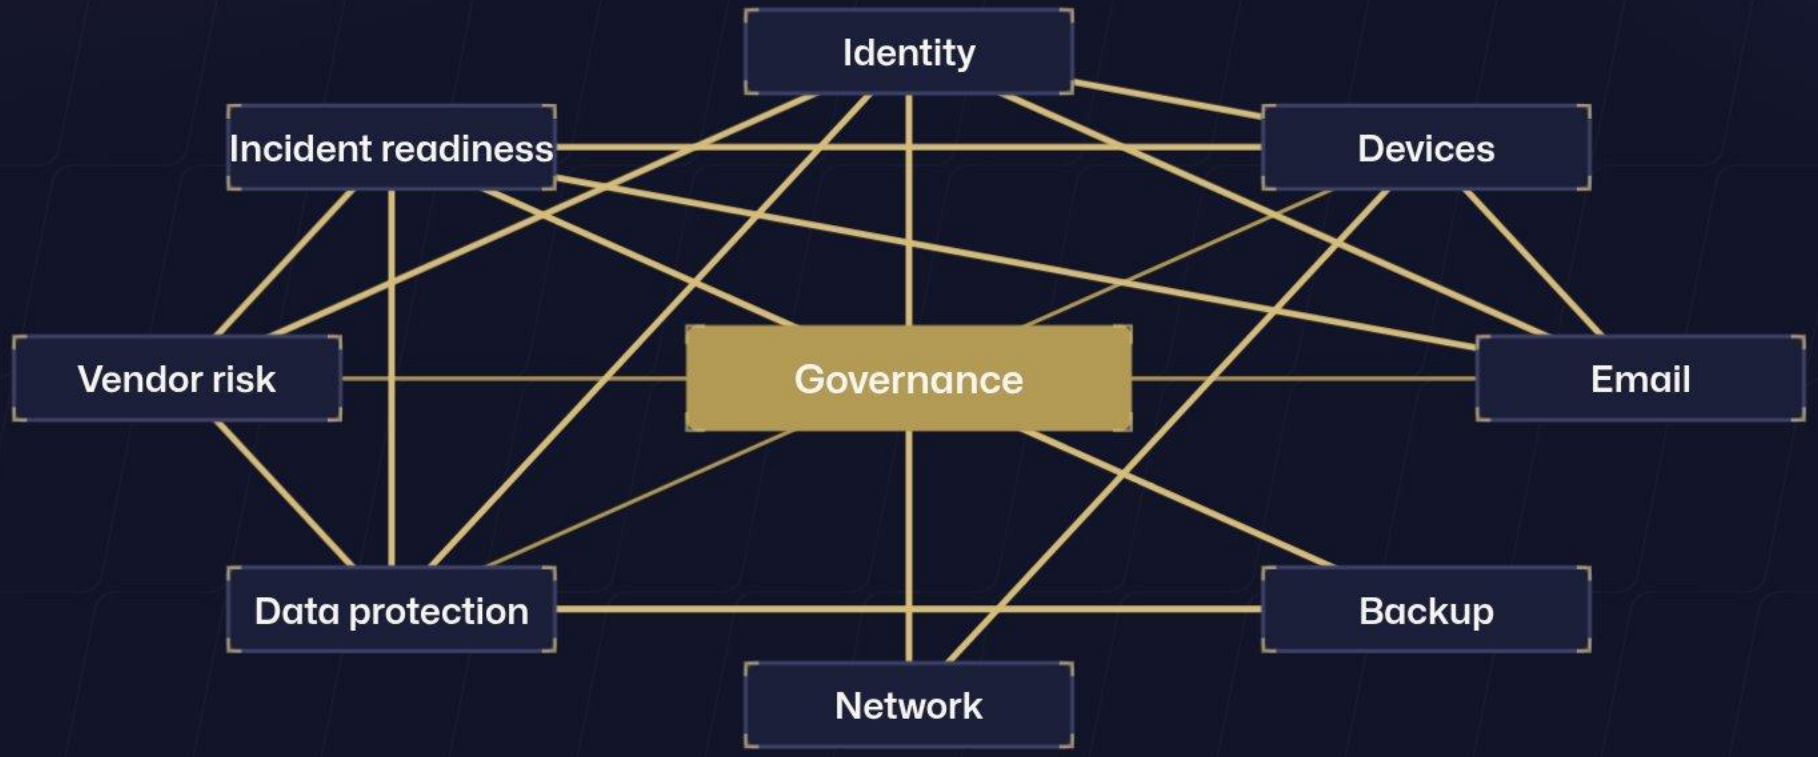

When A fails, B fails for A’s reason.

Pull one node. The web moves.

Governance

It isn’t one of eight. It’s what the eight are standing on.

Security doesn't fail in silos.
It fails in cascades.

Take that sentence and go argue with it.

You're not failing.
The model you were handed is.

Anodot

Snowflake / BigQuery

Vimeo

April 28, 2026

Anodot

Snowflake / BigQuery

Vimeo

Nobody broke into Vimeo.

They logged in. As Anodot.

~119,000 people.

Email addresses and metadata.

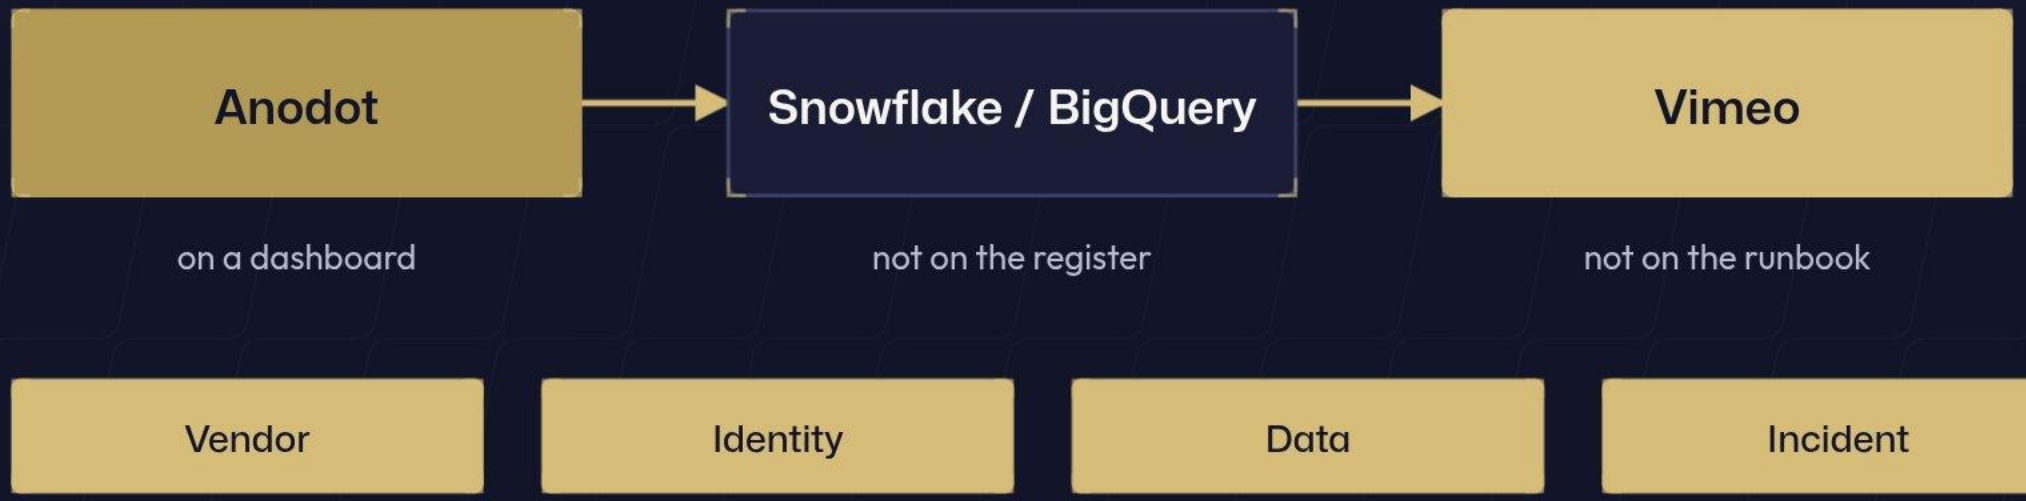

No passwords. No cards. No video.

on a dashboard

not on the register

not on the runbook

One integration. Four squares.

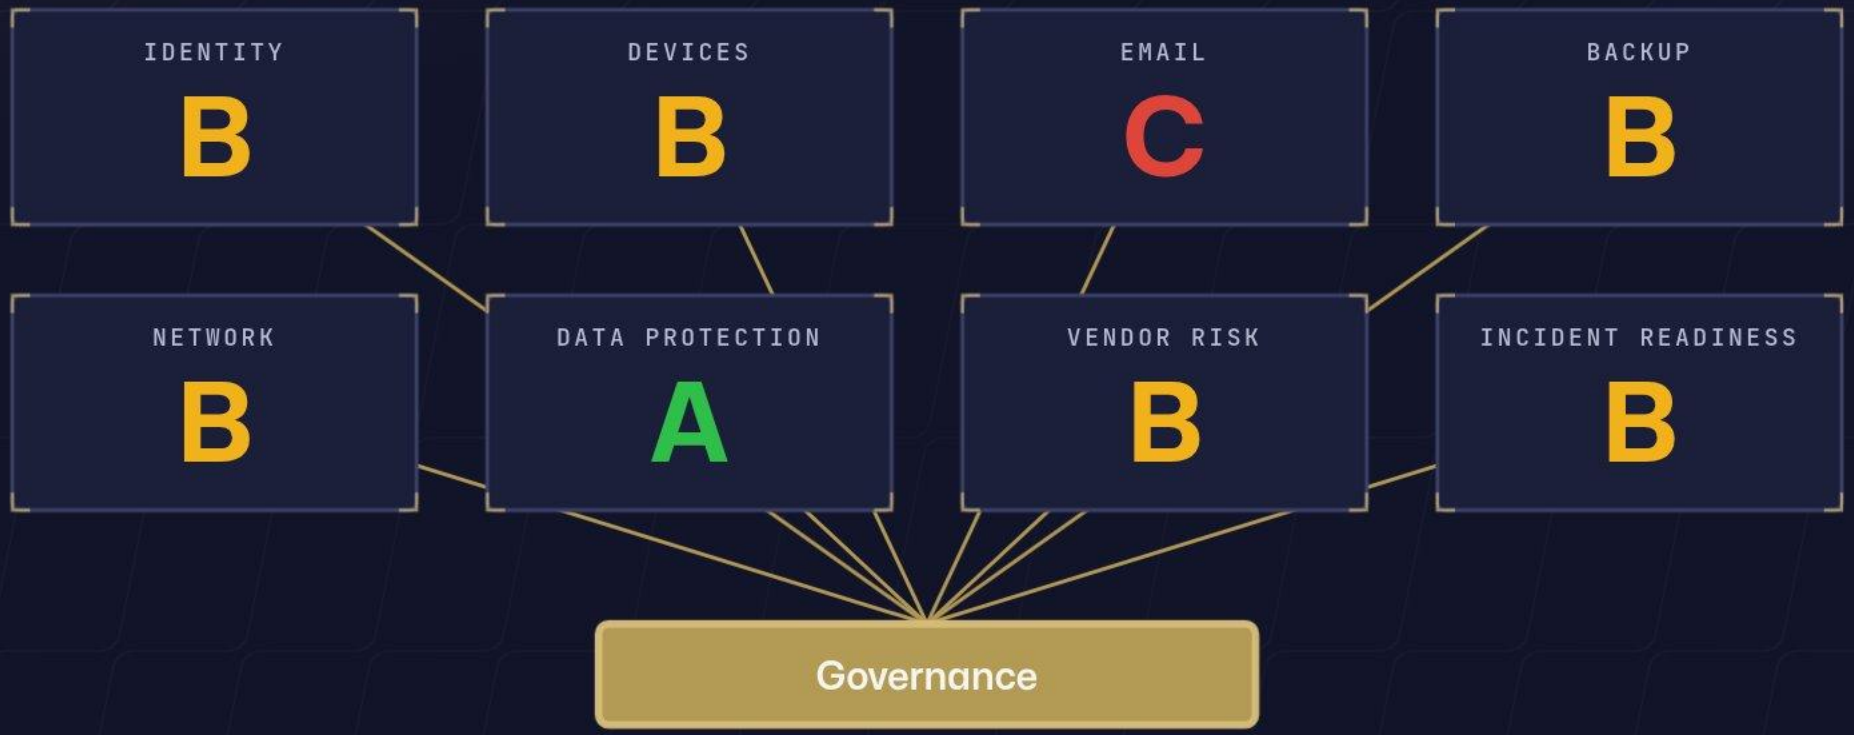

MOVEit · Snowflake 2024 · Cleo

Different years. Different vendors. One shape.

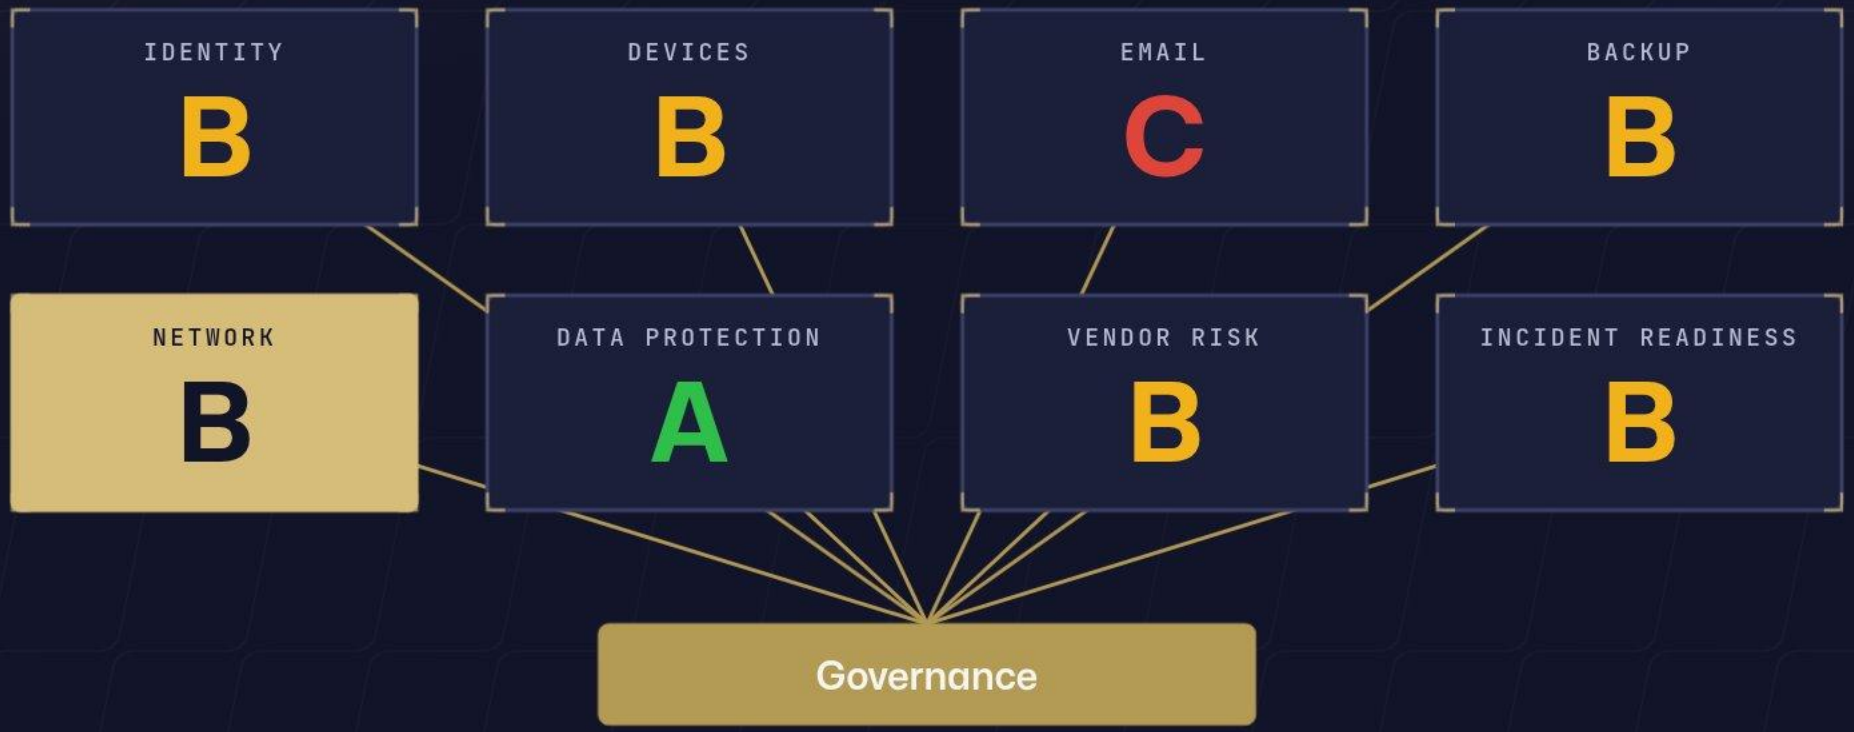

Same shape.
Different logos.

IDENTITY	DEVICES	EMAIL	BACKUP
B	B	C	B

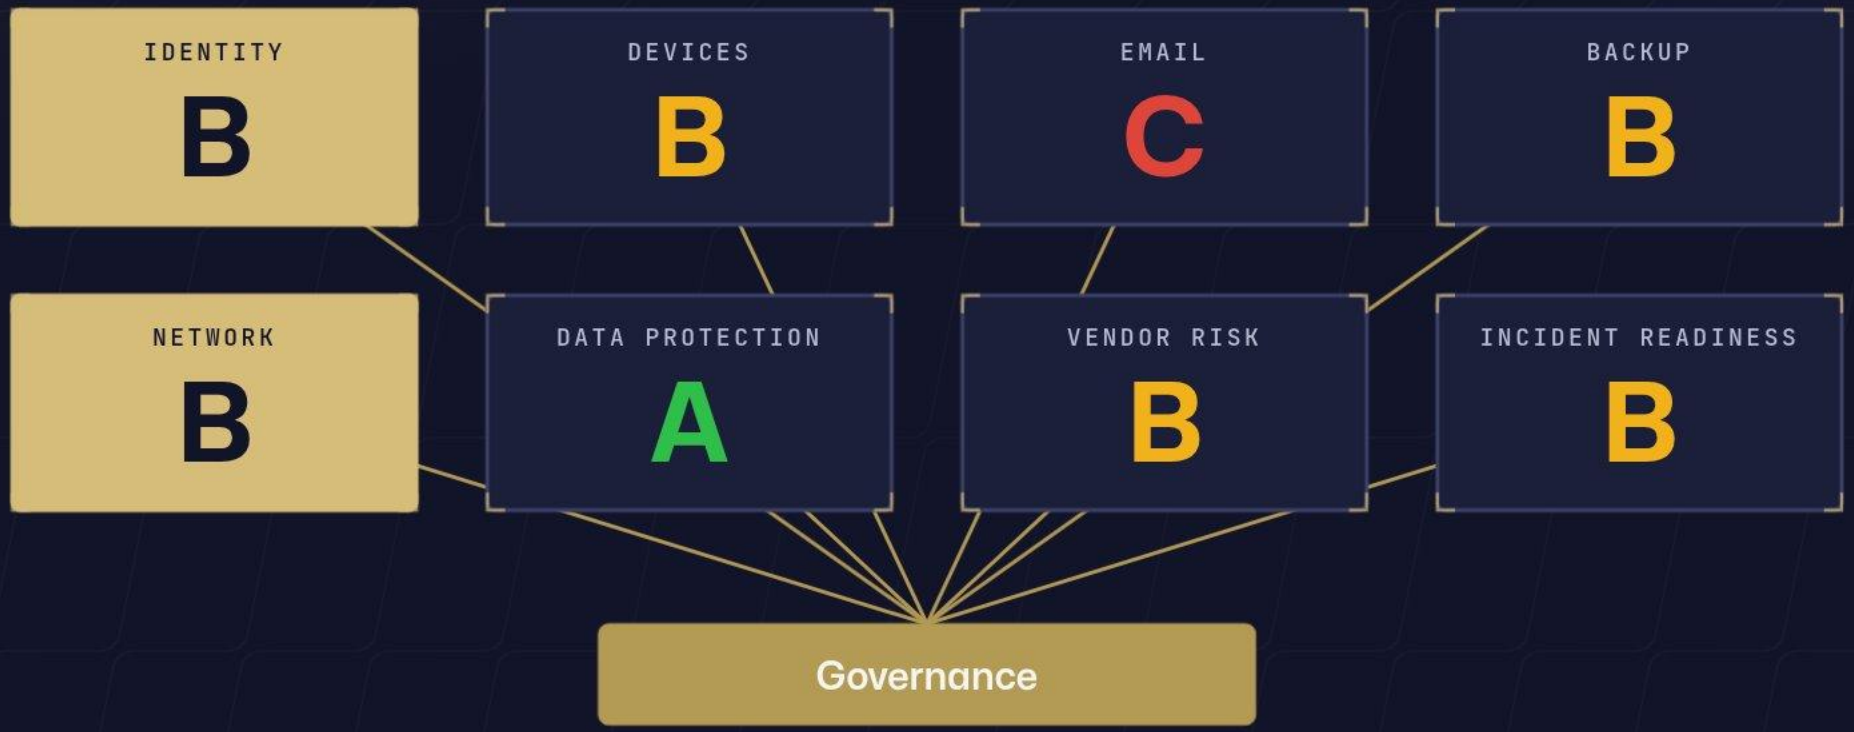

NETWORK	DATA PROTECTION	VENDOR RISK	INCIDENT READINESS
B	A	B	B

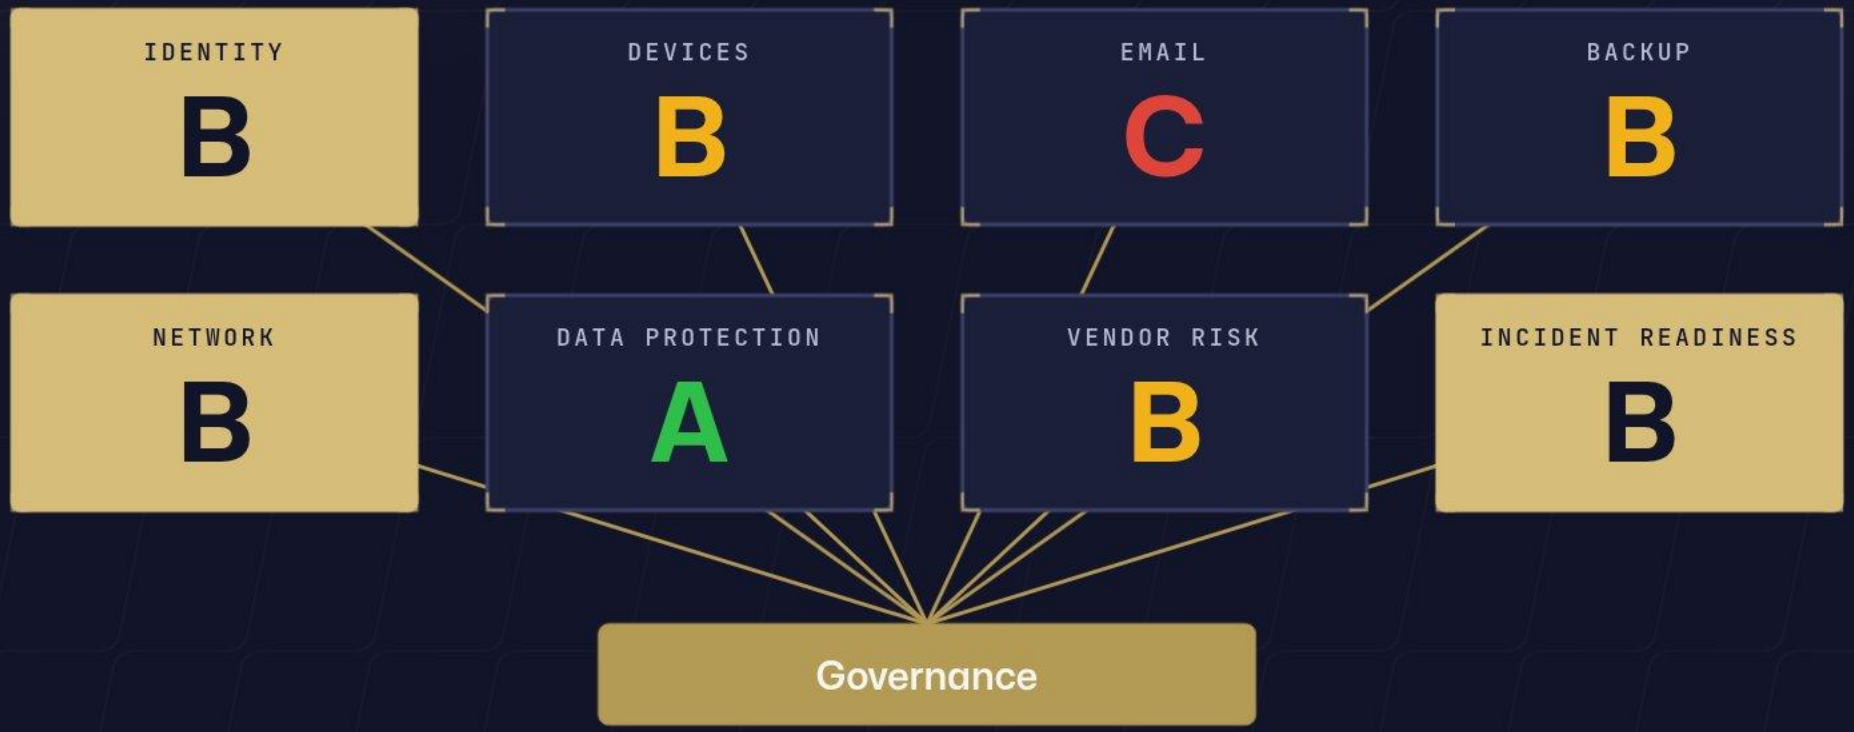

Not on the board. Not weak. **Absent.**

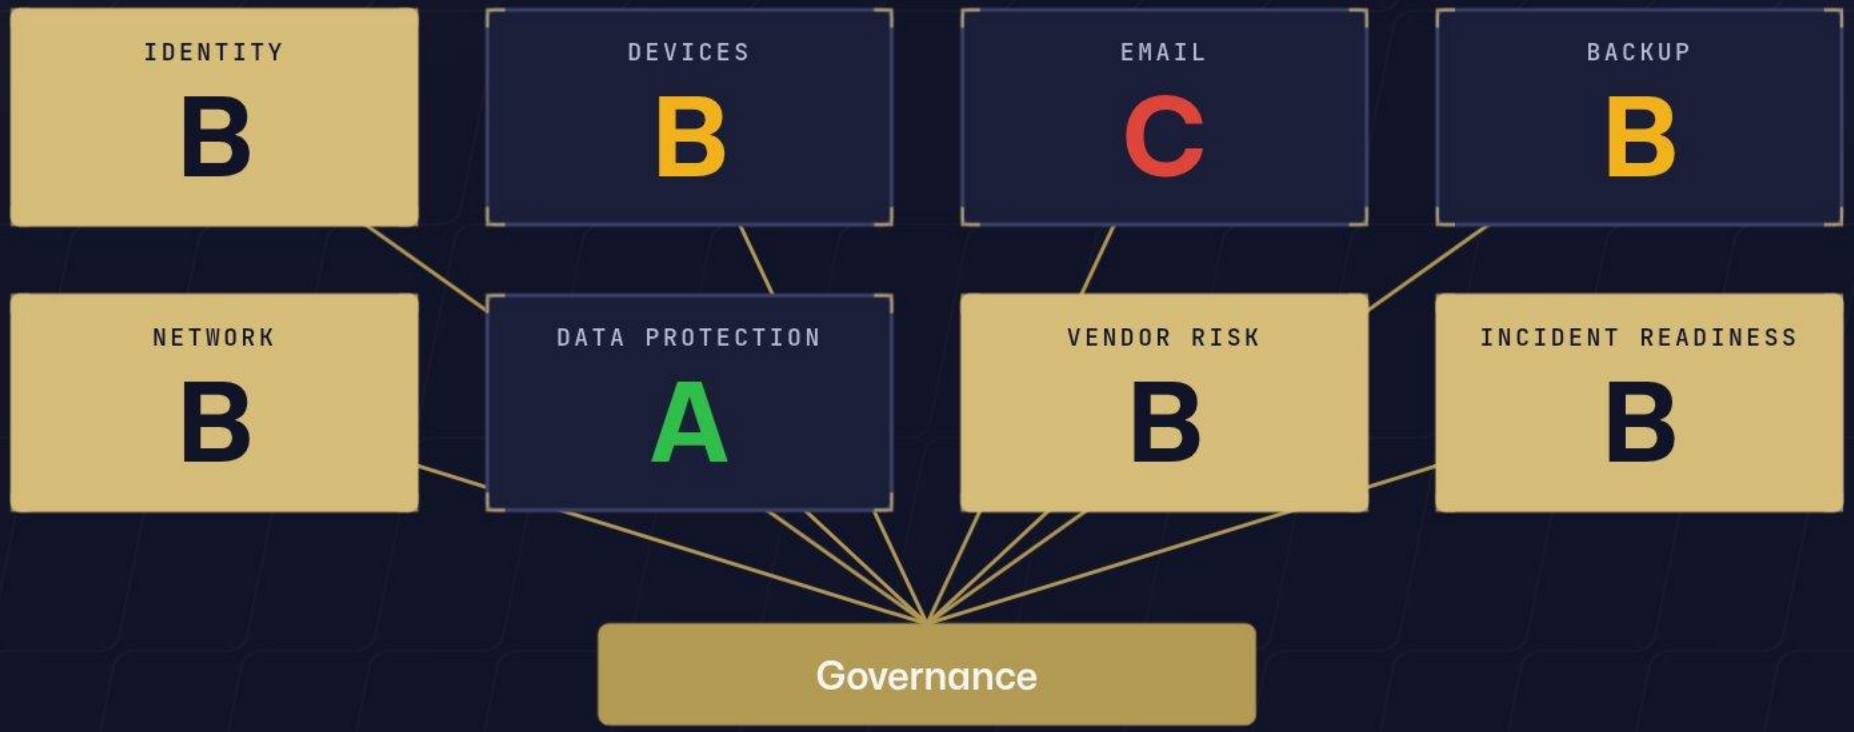

→ Audit finding

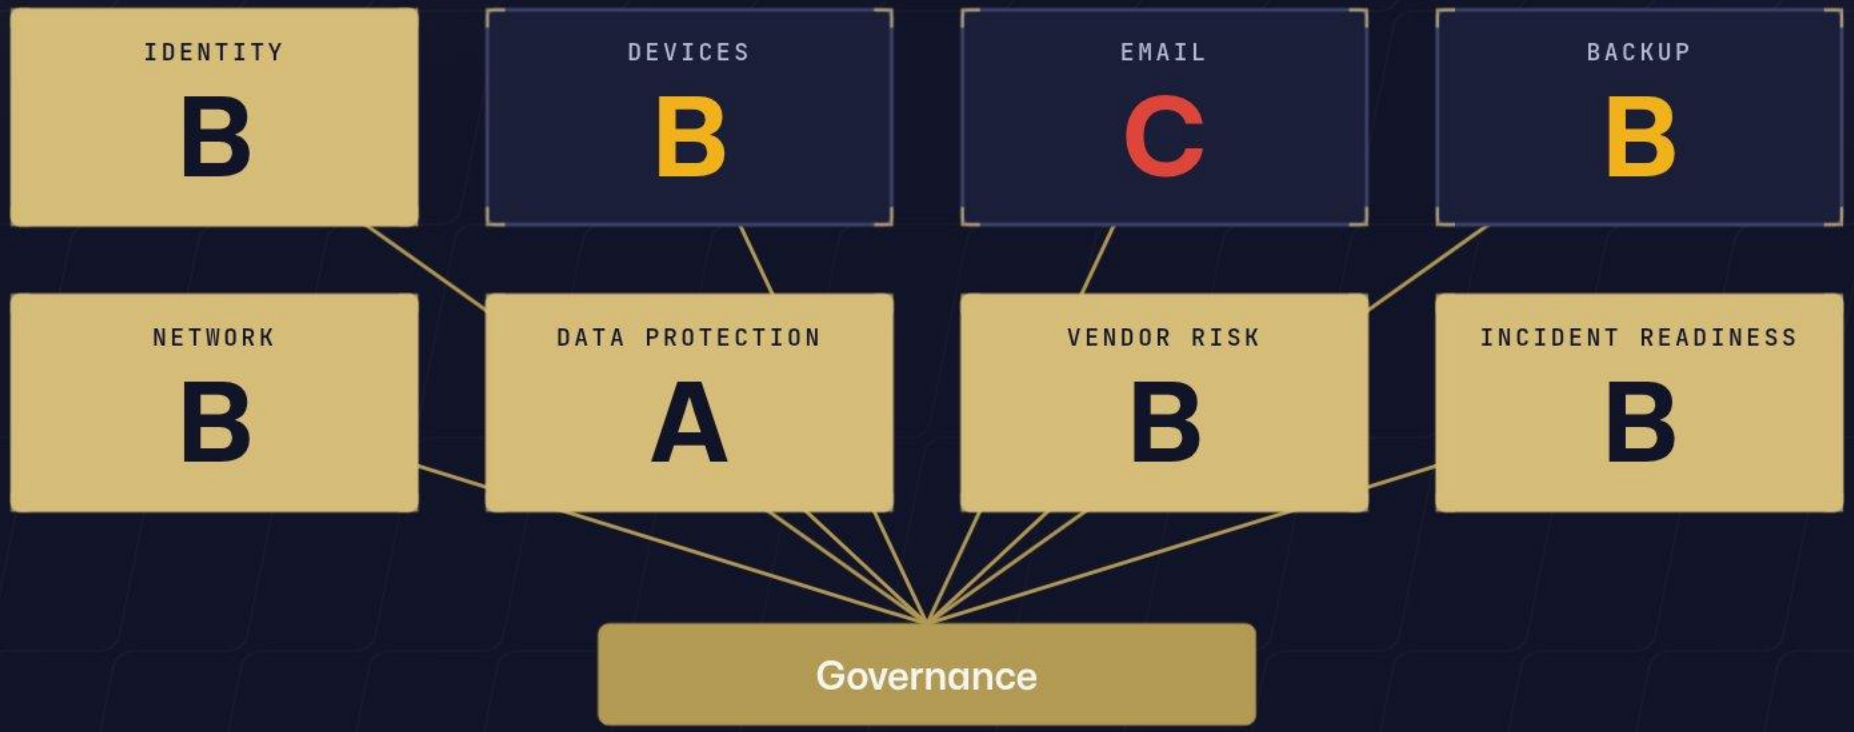

→ New engineer gets everything

→ No plan when someone clicks

→ “Describe your third-party risk program.”

→ Nobody classified anything

Same gap.
Different hats.

One gap. Five squares.
The grade said medium five times.

I've been the one
with the pen.

QUESTION 01

How many SaaS integrations hold tokens to your data warehouse right now?

QUESTION 01

How many SaaS integrations hold tokens to your data warehouse right now?

QUESTION 02

How many of those does your security team know about?

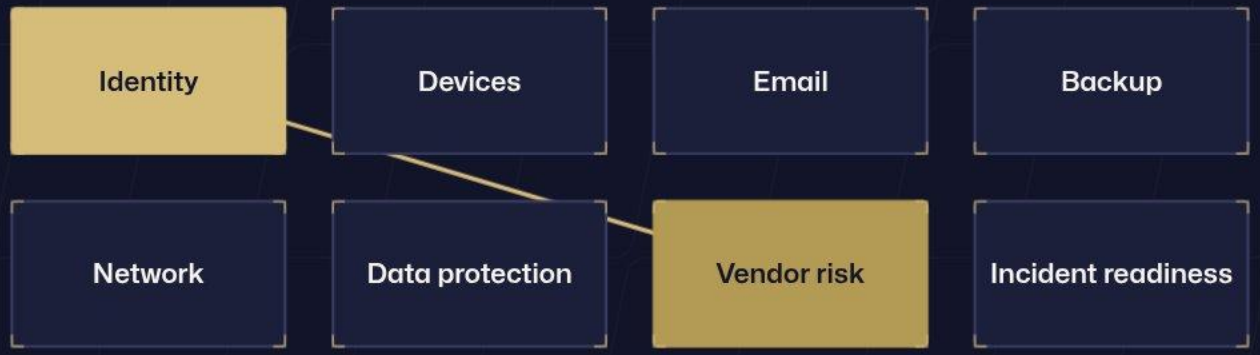

It’s a cascade
you haven’t drawn yet.

Not risk math. Obligation math.

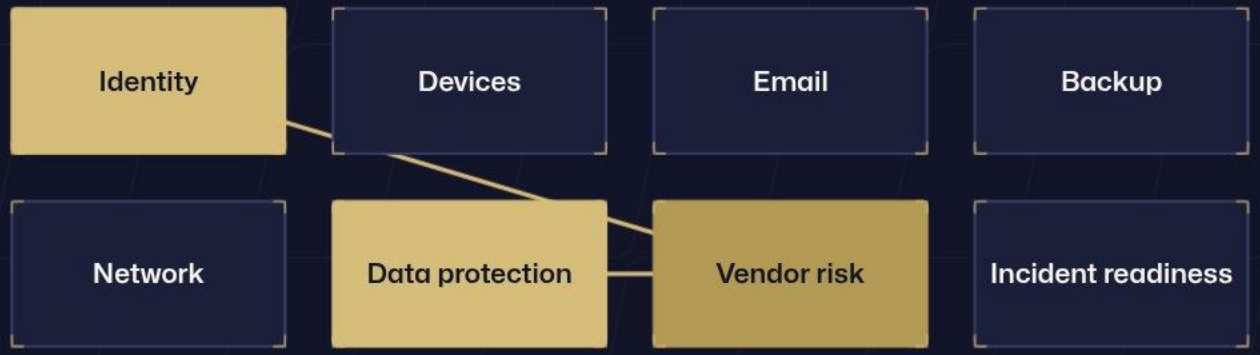

Vendor & SaaS risk · register: “third-party risk, medium.”

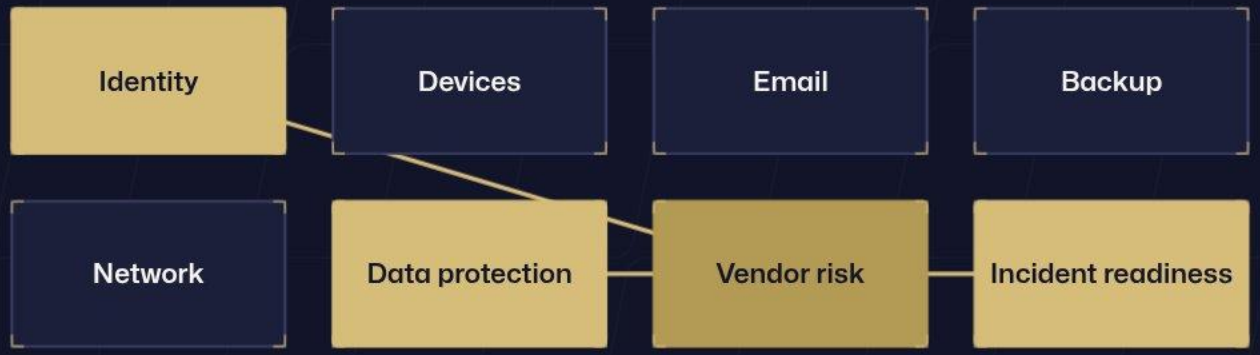

→ Identity & Access

→ Data Protection

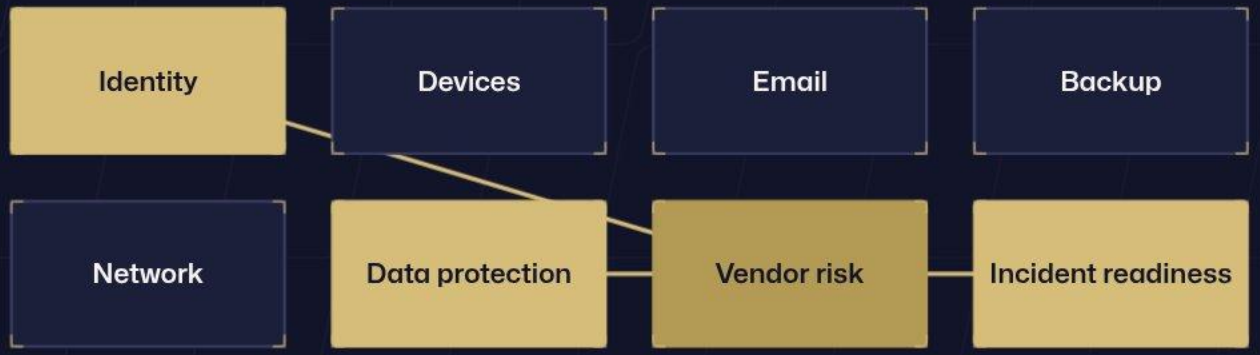

→ Incident Readiness

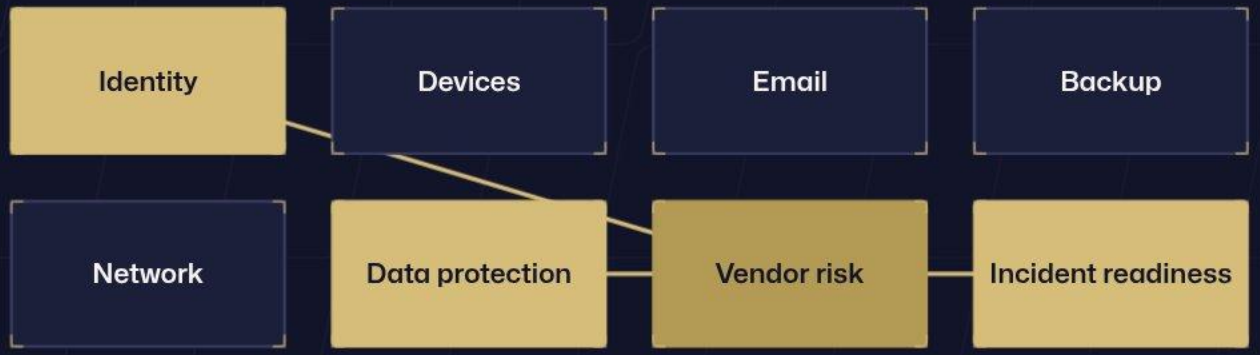

The obligations

7 so far · 1 domain

Dependency data: Sidekick Security Trust Map (public). Read backwards.

10 so far · 2 domains

Dependency data: Sidekick Security Trust Map (public). Read backwards.

14 so far · 4 domains

Dependency data: Sidekick Security Trust Map (public). Read backwards.

19 practices fail for its reason · 8 domains

Dependency data: Sidekick Security Trust Map (public). Read backwards.

Why, in their words

SSO & FEDERATION → DEPENDS ON THIRD-PARTY RISK

“Third-party vendor access often requires federation: TPRM must evaluate vendor identity practices.”

LEGAL & DATA GOVERNANCE → DEPENDS ON THIRD-PARTY RISK

“Vendor contracts and data processing agreements are negotiated through legal.”

CLOUD & HYBRID ARCHITECTURE → DEPENDS ON THIRD-PARTY RISK

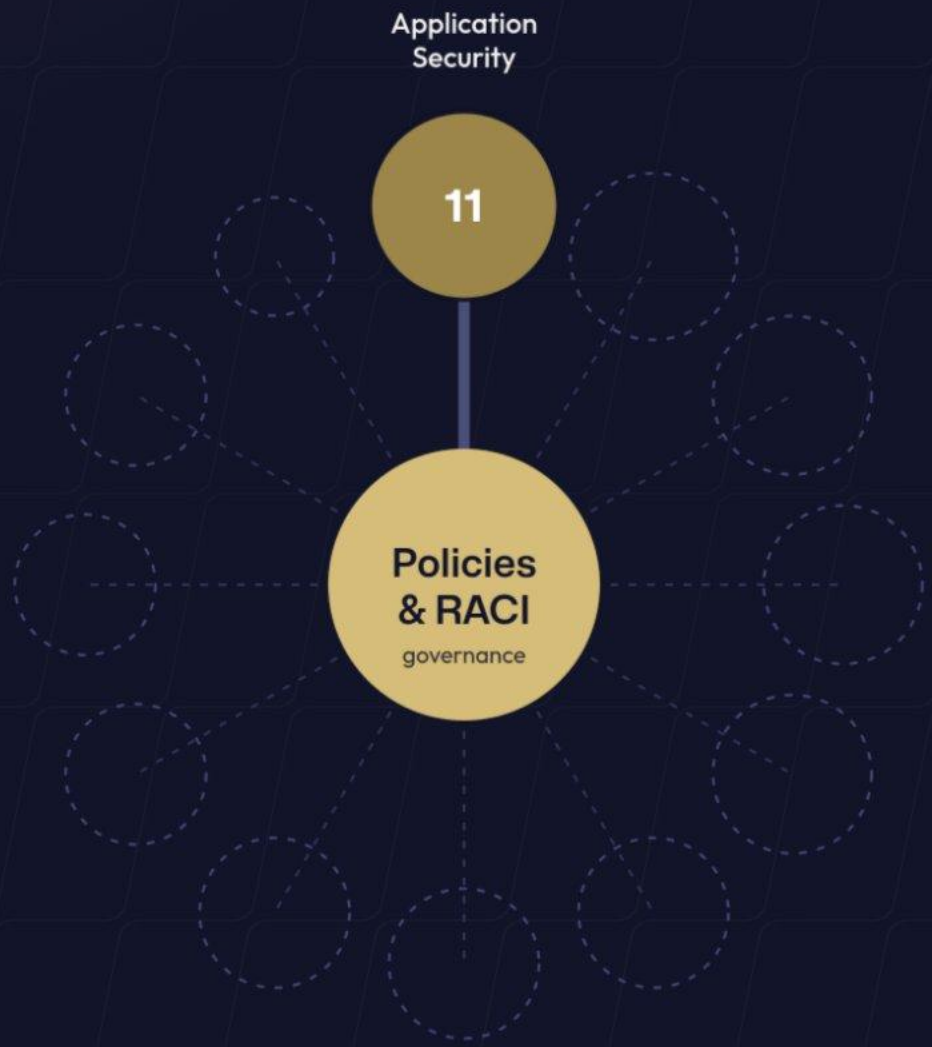

“Cloud vendors are third parties: their security posture must be assessed through TPRM.”

M&A SECURITY → DEPENDS ON THIRD-PARTY RISK

“Acquired company's vendor relationships become your third-party risk.”

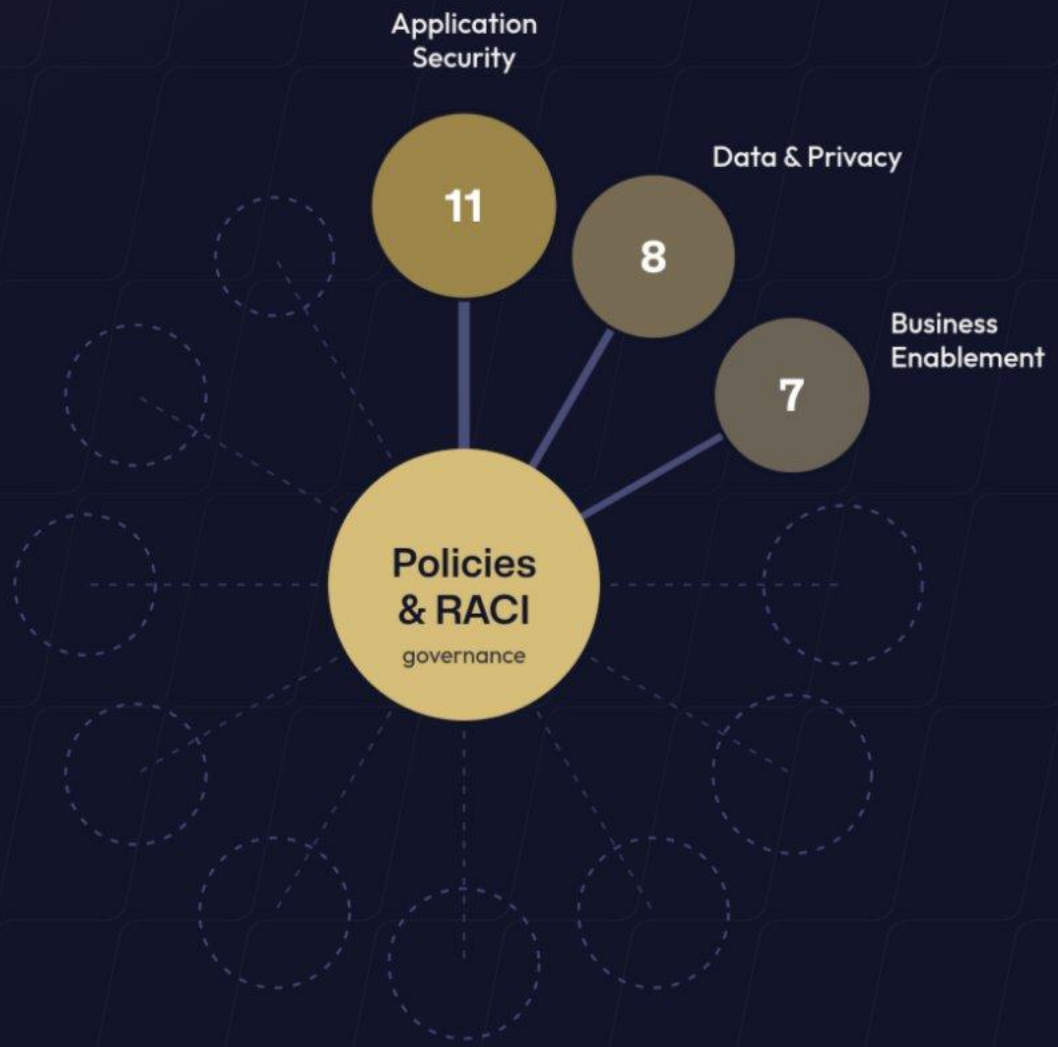

Dependency data: Sidekick Security Trust Map (public). Read backwards.

11 in the first domain alone

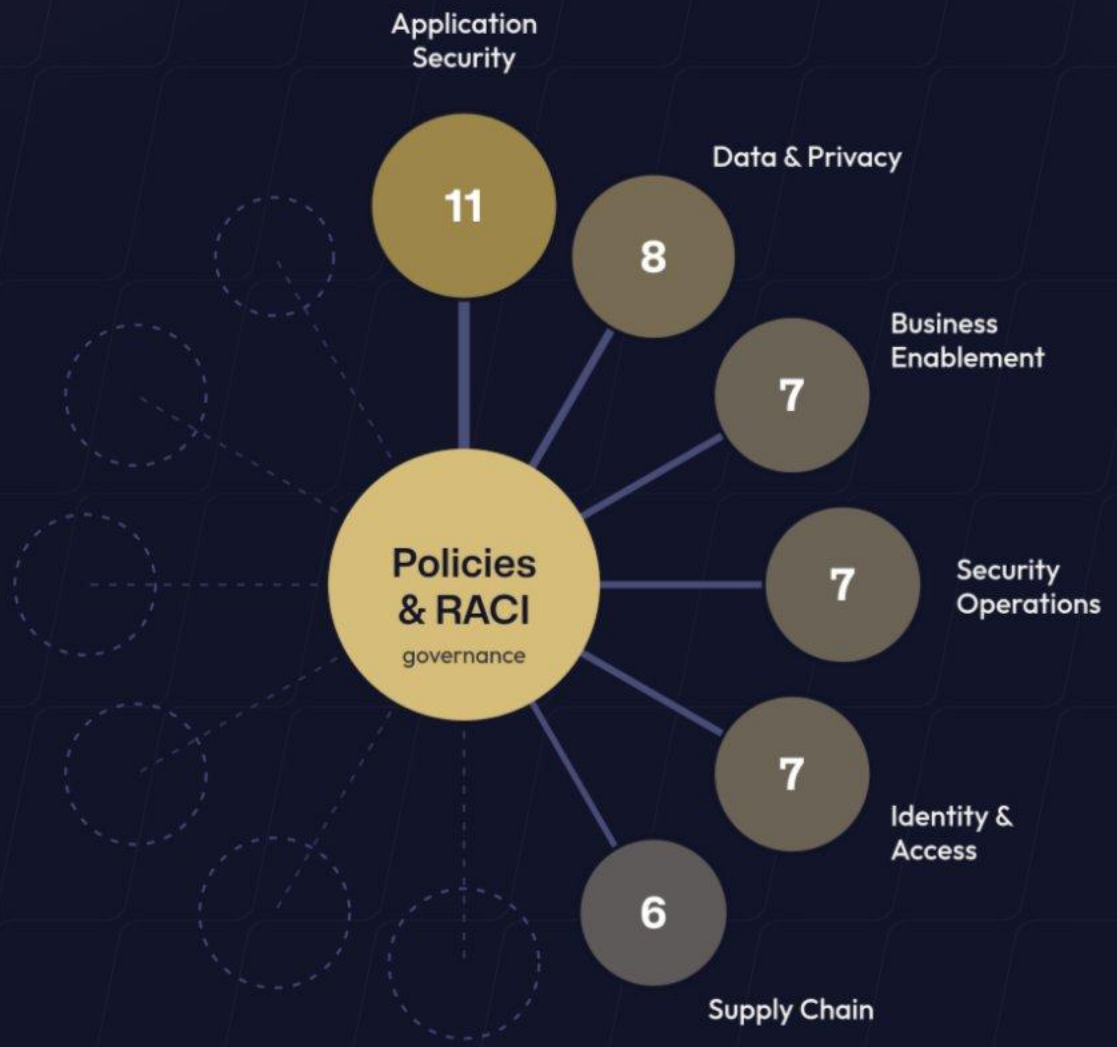

Dependency data: Sidekick Security Trust Map (public). Read backwards.

26 so far · 3 domains

Dependency data: Sidekick Security Trust Map (public). Read backwards.

46 so far · 6 domains

Dependency data: Sidekick Security Trust Map (public). Read backwards.

76 practices hang from it · all 12 domains

Next most-connected practice: 34

THE EIGHT MOST-DEPENDED-ON PRACTICES

1	**Policies & RACI**	76
2	**Risk Assessment & CRQ**	34
3	**Compliance & Audits**	27
4	**Frameworks & Standards**	25
5	**Strategy & Alignment**	24
6	Data Governance & Classification	22
7	Threat Detection & SOC	22
8	Vulnerability Management	21

Dependency data: Sidekick Security Trust Map (public). Read backwards.

*The domain I'd spent the least time on is the one **everything** hangs from.*

Version one.
Every edge counts the same.

It’s the structure, not your assessment.

MONDAY MORNING

01

02

03

MONDAY MORNING

01 Draw one edge.

02

03

MONDAY MORNING

01 **Draw one edge.**

Hand it to the owner at the other end. Ask: did you know?

02

03

MONDAY MORNING

01 **Draw one edge.**

Hand it to the owner at the other end. Ask: did you know?

02 **Find the tokens.**

03

MONDAY MORNING

01 **Draw one edge.**

Hand it to the owner at the other end. Ask: did you know?

02 **Find the tokens.**

Two lists. The difference is your Anodot.

03

MONDAY MORNING

01 Draw one edge.

Hand it to the owner at the other end. Ask: did you know?

02 Find the tokens.

Two lists. The difference is your Anodot.

03 Change the board slide.

MONDAY MORNING

01 **Draw one edge.**

Hand it to the owner at the other end. Ask: did you know?

02 **Find the tokens.**

Two lists. The difference is your Anodot.

03 **Change the board slide.**

From “are we secure” to “what fails first.”

MONDAY MORNING

01 Draw one edge.

Hand it to the owner at the other end. Ask: did you know?

02 Find the tokens.

Two lists. The difference is your Anodot.

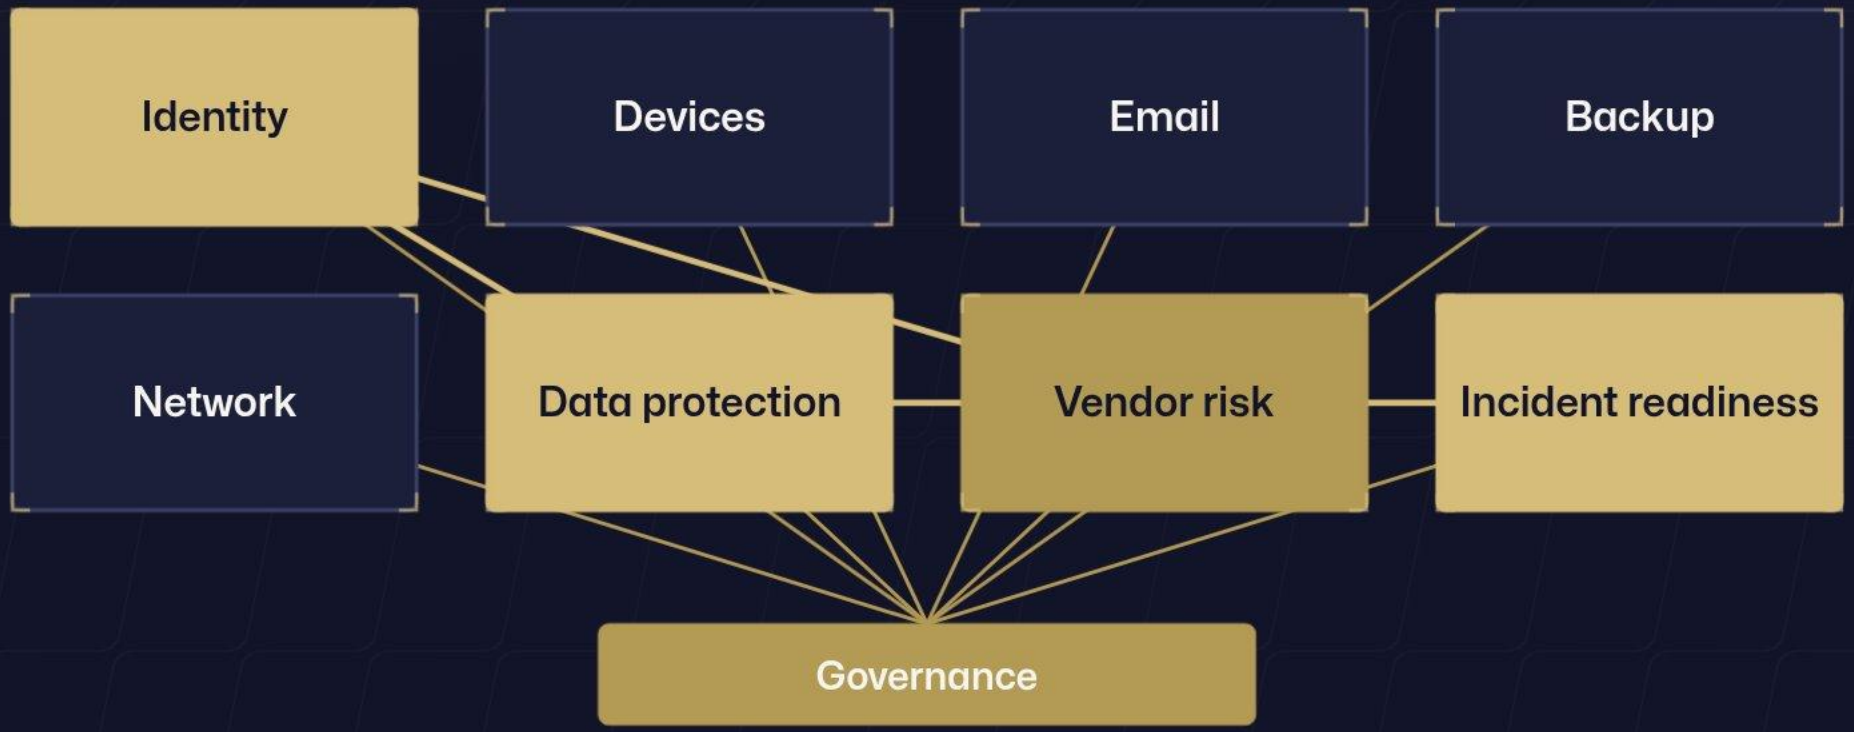

03 Change the board slide.

From “are we secure” to “what fails first.”

Complicated systems, you optimize.
Complex systems, you govern.

Same board. Same eight squares. Same B.

Same question. Different answer.

“Here’s what fails first.
Here’s what it takes down with it.
And here’s whose name is on the line between.”

When everything depends on everything.

Go draw the lines.
