The Cascade Worksheet

Three moves for Monday. Nothing to buy. About an afternoon, all in.

From the talk
When Everything Depends on Everything
Mike Faas · Triangle InfoSeCon 2026

01 Draw one edge

20 MINUTES · A PEN

Take your **worst-scored square**. Not the whole assessment, one square. Write three things in **other** squares that break if it stays broken. Not "it increases risk": what specifically stops working.

Worst-scored square

e.g. Vendor risk, C

Breaks in (square)	What specifically stops working	Owner	
			☐ They knew
			☐ They knew
			☐ They knew

Then hand this page to each owner and ask one question: *did you know this depended on you?* Every "no" is a line nobody had drawn before.

02 Find the tokens

AN AFTERNOON · TWO EMAILS

Not users. **Non-humans:** every analytics tool, BI connector, sync job, service account, API key and AI plug-in that can read your top two data stores.

List A · What can read the data

Ask whoever runs your data platform.

List B · What security recognizes by name

Ask your security lead, from List A.

A minus B = your Anodot. ☐ Kill what's dead ☐ Rotate what's alive ☐ Offboarding: "and the integrations they set up"

03 Change the board slide

FOR WHOEVER PRESENTS SECURITY

What fails first, and what it takes down

Fails first (your edge) → Takes down → And then

Obligations that fire

Clocks

Name on each line

RETIRE THE QUESTION

~~"Are we secure?"~~

ANSWER THIS ONE INSTEAD

"What fails first, and what does it take down with it?"

Replace the eight letter grades with one cascade path: the one from move 01. That's a question a leader can act on, and one a leader can fund.

THE QUESTION TO TAKE BACK

If one SaaS integration is breached tonight, which obligations fire, on what clocks, and who owns each one?

If the answer takes more than a day to assemble, you've found your cascade.
